**ASSISTANT COMMISSIONER FOR PATENTS**  
 Washington, D. C. 20231

Case Docket No. VGT 0143 PUS  
 Date: October 27, 2000

Sir:

Transmitted herewith for filing is the patent application of Inventor(s):

Brian J. Andonian

For: **Simulated Steering Feel System**

Enclosed are:

- ☒ 1 sheet(s) of drawings
- ☒ Executed Declaration
- ☒ Assignment and Cover Sheet
- ☒ Information Disclosure Statement, PTO Form 1449, and Copies of Citations
- ☐ A certified copy of

The filing fee has been calculated as shown below for OTHER THAN A SMALL ENTITY:

FOR	NO. FILED	NO. EXTRA	RATE	FEE
Basic Fee				\$ 710
Total Claims	23	0	18	\$ 54
Indep Claims	3	0	80	\$ 0
Multiple Dependent Claims(s)	0		270	\$ 0
Presented				
Assignment Fee				\$ 40
			TOTAL	\$ 804

- [X] Please charge Deposit Account No. 06-1500 in the amount shown next to the Total.  
A duplicate copy of this sheet is enclosed.
- [X] The Commissioner is hereby authorized to charge payment of the following fees associated with this communication or credit any overpayment to Deposit Account No. 06-1500. A duplicate copy of this sheet is enclosed.  
Any additional filing fees required under 37 CFR 1.16.  
Any patent application processing fees under 37 CFR 1.17.
- [X] The Commissioner is hereby authorized to charge payment of the following fees during the pendency of this application or credit any overpayment to Deposit Account No. 06-1500.  
Any patent application processing fees under 37 CFR 1.17.  
Any filing fees under 37 CFR 1.16 for presentation of extra claims.

# **SIMULATED STEERING FEEL SYSTEM**

## **Technical Field**

The present invention relates generally to a simulated steering feel system and more particularly to  
5 a simulated steering feel system utilizing a servo disk motor.

## **Background Of The Invention**

The use of simulated steering feel systems (SSFS) is well known in the prior art. SSFS's are  
10 presently used for a variety of applications including automotive drive simulators, engineering research tools, and entertainment devices. In addition, as advancements in automotive design continue to progress, advancements such as steer by wire (SBW) will likely  
15 require SSFS's in order to provide "road feel" or feedback response to a driver.

Although new improved uses of SSFS's will continue to develop, current SSFS can have undesirable characteristics. Current SSFS designs commonly use  
20 conventional brush or brushless electric motors. Such conventional electric motors can have disadvantages. Often conventional electric motors add undesirable weight to the SSFS's. Application work requirements can also lead to the need for undesirably large and  
25 heavy conventional motors. The high inertia of some conventional motors can also limit the acceleration capabilities of conventional motors and thereby limit the performance characteristics of the SSFS's in which

they are used. In addition, conventional motors can create torque ripple or "cogging" effects which are highly undesirable.

It would, therefore, be highly desirable to have a simulated steering feel system with reduced size and weight and that contains further improvements over present SSFS designs utilizing conventional brush or brushless motors.

### Summary of the Invention

It is therefore an object of the present invention to provide a simulated steering feel system that allows for reduced size, increased performance, and eliminates cogging.

In accordance with the objects of the present invention, a simulated steering feel system is provided. A simulated steering feel system includes a servo disk motor. The servo disk motor is utilized to allow feedback torque to a steering wheel. Using this servo disk motor, road feel can be imparted to the steering wheel from a small reduced weight package with improved performance.

Other objects and features of the present invention will become apparent when viewed in light of the detailed description of the preferred embodiment when taken in conjunction with the attached drawings and appended claims.

## Brief Description Of The Drawings

FIGURE 1 is an embodiment of a simulated steering feel system in accordance with the present invention for use in an automobile; and

FIGURE 2 is an embodiment of a simulated steering feel system in accordance with the present invention for use in a driving simulator.

## Description Of The Preferred Embodiment(s)

Referring now to Figure 1, which is an illustration of an embodiment of a simulated steering feel system 10 in accordance with the present invention. The embodiment illustrated in Figure 1 is preferably for use in an automobile to be used in conjunction with the steer by wire system, although the illustrated embodiment can be used in conjunction with any automotive system where simulated steer feel is desired. In an alternate embodiment, whose descriptions will follow, the simulated steering feel system 10 can be used in a variety of applications, including applications independent of an automobile.

The simulated steering feel system 10 includes a servo disk actuator 12. In its basic form, the servo disk actuator 12 includes at least one servo disk motor 14. Servo disk motors are well known in the electronic industry. Servo disk motors are also commonly referred to as disk motors, printed circuit board motors, or pancake motors. One advantage of using a servo disk motor, is that servo disk motors provide higher torque with a smaller package than

conventional electric motors. In addition, servo motors do not suffer from torque ripple or cogging effects commonly found in conventional electric motors. Servo disk motors also provide smoother torque with improved acceleration. Although the servo disk actuators 12 can include only a servo disk motor 14, alternate embodiments may include additional components.

In one embodiment, the servo disk actuator 12 can additionally include a torque multiplier 16. Torque multipliers are well known in the prior art. Torque multipliers 16 commonly consist of pulleys, belts, or gear reducers, although a variety of torque multipliers 16 are known. It is known that torque multipliers 16 can be combined with servo disk motors 14 to magnify the torque generated by the servo disk motor 14. It is known that torque multipliers 16 are available in a variety of reduction ratios. Common ranges of reduction ratios vary from 10:1 to 100:1, although additional reduction ratios are possible.

In still another embodiment, the servo disk actuator 12 can include a steering wheel sensor 18. The steering wheel sensor 18 can be utilized to measure a variety of characteristics of a steering wheel 20 including, but not limited to, angle, velocity, acceleration, and torque of the steering wheel 20. In other embodiments, the steering wheel sensor 18 and the steering wheel 20 may be replaced by any known input device sensor (not shown) and corresponding input device (not shown) such as a joystick or similar game device.

create a closed loop system wherein "road feel" is further improved.

The use and feel of such steering feel control processors is well known in the prior art.

5 Although the simulated steering feel system 10 may be powered by a variety of sources, in one preferred embodiment, the simulated steering feel system 10 is powered by an automotive battery 30.

Although the simulated steering feel system  
10 10 has thus far been described in terms of an in vehicle system, the simulated steering feel system 10 can be used in a variety of other applications. Such additional applications can include, but are not limited to, laboratory testing of steering feel tuning,  
15 automotive driving simulators, or entertainment devices (such as arcade games or home entertainment units). When used in such applications, a steering feel control processor 22 can be any controlling computer device. In addition, vehicle dynamic sensors 26 can be replaced by  
20 vehicle dynamic models 32, or other informational sources containing information on "road feel" (see Figure 2). The vehicle dynamic models 32 can consist of automotive performance models or gaming simulation data, or a variety of other informational sources. In  
25 addition, in these embodiments, it is contemplated that the simulated steering feel system 10 may be supplied by any acceptable power source.

While the invention has been described in connection with one or more embodiments, it is to be  
30 understood that the specific mechanisms and techniques which have been described are merely illustrative of

### What Is Claimed Is:

1. A simulated steering feel system comprising:

a servo disk motor, said servo disk motor capable of imparting feedback torque to an input device.

2. A simulated steering feel system as described in claim 1 further comprising a steering feel control processor.

3. A simulated steering feel system as described in claim 1 further comprising at least one vehicle dynamic sensor.

4. A simulated steering feel system as described in claim 1 further comprising:

a torque multiplier, said torque multiplier utilized to magnify torque generated by said servo disk motor.

5. A simulated steering feel system as described in claim 4 wherein said torque multiplier is a gear reducer.

6. A simulated steering feel system as described in claim 1 wherein said input device is a steering wheel.

7. A simulated steering feel system as described in claim 1 further comprising a steering wheel sensor element.

8. A simulated steering feel system as described in claim 1 for use in a driving simulator.

09606395-102700

9. A simulated steering feel system as described in claim 1 for use in an entertainment device.

10. A simulated steering feel system as  
5 described in claim 1 for use in an automobile in conjunction with a steer by wire system.

11. A simulated steering feel system as described in claim 1 further comprising:

a motor driver element, said motor driver  
10 element utilized to operate said servo disk motor.

12. A simulated steering feel system comprising:

a servo disk motor; and

a torque multiplier, said torque multiplier  
15 used in conjunction with said servo disk motor to impart road feel to a steering wheel.

13. A simulated steering feel system as described in claim 12 wherein said torque multiplier is a gear reducer.

20 14. A simulated steering feel system as described in claim 12 further comprising:

a steering feel control processor.

15. A simulated steering feel system as described in claim 12 further comprising:

25 at least one vehicle dynamic sensor.

16. A simulated steering feel system as described in claim 12 further comprising a steering wheel sensor element.

17. A simulated steering feel system as  
30 described in claim 12 further comprising:

a motor driver element, said motor driver element utilized to operate said servo disk motor.

18. A simulated steering feel system as described in claim 12 for use in a driving simulator.

5 19. A simulated steering feel system as described in claim 12 for use in an entertainment device.

20. A simulated steering feel system as described in claim 12 for use in an automobile in  
10 conjunction with a steer by wire system.

21. A method of creating simulated steering feel comprising:

determining an appropriate feedback torque;  
and

15 transmitting said feedback torque towards the steering wheel using a servo disk motor.

22. A method of creating simulated steering feel as described in claim 21 wherein determining appropriate feedback torque comprises the steps of  
20 measuring vehicle dynamics characteristics; and

imputing an appropriate feedback torque using said vehicle dynamic characteristics.

23. A method of simulating steering feel as described in claim 21 further comprising the step of  
25 increasing the output of said servo disk motor using a gear reducer.

### **Abstract Of The Disclosure**

A simulated steering feel system 10 for use  
in a vehicle, Laboratory Simulator, or entertainment  
device employs a servo disk motor 14. The servo disk  
5 motor 14 is utilized to import improved torque feedback  
to a steering wheel or input device.
